Speed vpn android

Continue

What VPN would you recommend for an Android user who uses public WiFi quite often and wants to buff up their security? Welcome to our “Got Answers?” series (which is normally published each Thursday) where we are helping fellow members get answers to their tech questions. Are you the one who can offer advice or tips to help your fellow member with their questions? Do you have your own tech questions? Post them in our forums where you can receive answers from your fellow members. You use public WiFi on your Android device quite often, however, in this day and age, you want to be more secure, so you are looking for a VPN to install. This is where TechRepublic member indigofurr has found themselves and has turned to the TechRepublic community for assistance in helping them figure out which VPN to use. TechRepublic member indigofurr writes, “I’m looking for a VPN service for my Android since I’m on public WiFi a lot and want to buff up my protection. Right now I’m considering Surfshark because it uses IKEv2 protocol and it’s stated that it drains less of your phone battery. I searched but couldn’t really find other VPNs that offer IKEv2 for Androids, maybe you have some recommendations so I can do a comparison?” Are you able to help indigofurr with their question? Simply click the “Answer This” button below: The TechRepublic Forums is a community of IT Experts, where you can go to seek advice, share your knowledge, brainstorm, shoot the breeze and enjoy the camaraderie of your IT peers. So, if you haven’t already – be sure to check out the forums today! More Tech Help Questions from the TechRepublic Forums See Also: Previous “Got Answers?” Question(s) Image: CNET Did you know that Google has a VPN for Android? It’s called Google One VPN, and it’s secure, fast, and incredibly easy to use. Google’s take on the VPN offers a much-needed layer of security to your mobile device, especially when you’re on the go. The Google VPN hides your IP address to prevent third-parties from tracking you and doesn’t use the VPN connection to track or log your activity. Even better, the client libraries for the Google One VPN are open source and the end-to-end systems will be independently audited in 2021. One thing that the Google VPN offers that many other solutions cannot match is that there is next to no noticeable speed reduction. That means you can leave the VPN running at all times without it interfering with your mobile experience. But how do you use this tool? Let me show you. SEE: Identity theft protection policy (TechRepublic Premium) What you’ll need As of this writing, the Google VPN only works with Android, so you’ll need an Android device–there are plans to add iOS, Windows, and macOS clients in the future. You’ll also need to be in the US, as the VPN is currently only supported in that region, with more regions coming soon. The other thing you’ll need is a 2 TB (or larger) Google Drive plan. That plan will cost you $9.99/month, but if you’re a Drive power user, that’s a pretty cheap price, given the amount of space you’re getting. Plus, you get the VPN service added on top of that, so it’s a win-win. How to install the Google VPN Client Once you’ve upgraded to the 2 TB Google Drive plan, you should find Google VPN added to Google One at the next update. If you don’t, you can head over to the Google Play Store and either install Google One or update it manually, as it should already be on your device. How to use the Google VPN Client Now it’s time to enable that VPN client. On your Android device, open the App Drawer and launch Google One. In the Google One app, you’ll see an entry for the VPN. To enable the service, tap Enable VPN (Figure A). Figure A Enabling the Google VPN is just a tap away. This will open a new window, where you must tap the On/Off slider until it’s in the On position (Figure B). Figure B Enabling the Google VPN. When prompted, tap OK so Google can set up the VPN connection (Figure C). Figure C Okay the Google VPN connection. You should see a small key icon in the notification bar at the top of your display indicating the VPN is on (Figure D). Figure D The Google VPN is now enabled and is securing your connection. How to make it easier to enable/disable Now that you know how to turn the VPN on, let’s make it a bit easier. Pull down your notification shade twice and then tap the pencil icon in the Quick Tiles window (Figure E). Figure E The Quick Tiles section of the Android notification shade. Locate the Google VPN tile, then tap and drag it into the Quick Tiles section at the top. Once you have it where you like it, tap the back arrow in the upper-left corner of the Quick Tiles section, and you’re good to go. You can now enable/disable the Google VPN from the Quick Tiles section of the notification shade. Speed testing the VPN After enabling the VPN, I ran a quick speed test comparison (using speedtest.net) with the service on and with it off. The results are telling: With VPN on: 89.23 Mbps With VPN off: 93.74 Mbps Clearly the Google One VPN doesn’t reduce your networking speeds by much. In fact, it’s hardly noticeable, which is a huge plus for a VPN. For anyone looking to find a VPN that is as performant as it is secure, Google One VPN might be exactly what you’re looking for. Subscribe to TechRepublic’s How To Make Tech Work on YouTube for all the latest tech advice for business pros from Jack Wallen. (Image credit: NASA) While it’s common knowledge that even the best VPN will slightly slow down your maximum connection speed, few people know that one of the most ingenious VPN uses is speeding up your connection. But how can that work?Here, we’re going to give you a brief guide on how to use a VPN to speed up your internet connection, in what situations that might be possible, and if it’s something worth you doing.How does a VPN speed up internet?Every internet plan on the market has a maximum speed – that could be 10Mbps or 600Mbps, or anywhere in between and sometimes higher – but that’s not the speed you’ll experience all the time. Your ISP (internet service provider) monitors its customers’ traffic and, if it detects certain activities, it can ‘throttle’ your connection.Throttling is the controversial practice of slowing down individual users’ connections to either discourage them from engaging in a certain activity or save bandwidth at peak times. Sometimes an ISP will throttle every user’s connection – something a VPN can’t avoid – but for selective throttling a VPN is very useful.How can a VPN avoid network throttling?ISPs can see what you’re doing with your internet connection, and they monitor this for activity which is worthy of throttling. Sometimes that could be gray areas such as torrenting, but it has also been observed in innocent yet high-bandwidth situations like online gaming and streaming HD TV.No matter what you’re doing on the web, we think you should be getting what you pay for from your ISP. If you want to guarantee that, use a VPN.A VPN directs your connection through its own encrypted servers to entirely anonymize your traffic. That means no one, including your ISP, the government or even the VPN itself can see what you’re using your bandwidth for. In turn, that means your ISP can’t single you out as a user who is, for example, sharing P2P, and subsequently can’t make the decision to throttle your connection.(Image credit: Future) (opens in new tab)What VPN is best for avoiding throttling?It goes without saying that if you want to avoid network throttling you’ll need a fast VPN. On top of that, you’ll also want rock-solid security features to make sure your personal data isn’t compromised, and a reliable support system (ideally 24/7 live chat) to assist if you notice your connections dropping or need help setting up. Since a slow internet connection can ruin any gaming experience, both serious and casual gamers might be curious to know if the best VPN can speed up their internet when gaming.For those who are unfamiliar with VPNs, they can protect your online privacy by rerouting your internet connection through a secure server, which can be located anywhere in the world. This prevents your internet service provider, as well as hackers and other nefarious forces, from spying on your online activity.With a VPN, you can browse the internet as it would appear in another country, simply by rerouting your connection through a server in that region, and even watch streaming content that is exclusive to other countries.In this article, we go over whether using a gaming VPN can speed up your internet connection, and help avoid network throttling that can kill your gameplay.Want more viewing variety? Here's how to change region on NetflixDo VPNs slow down your internet?To some extent, it is true that a VPN can slightly slow your internet connection – VPNs add a layer of encryption that may lead to a small reduction in speed. In addition, if you’re using a VPN with a limited number of servers (common with many free VPN services), the servers may become overloaded. This will almost certainly lead to slower internet speeds.If you choose to connect to a server in a country that is far away from you when using a VPN, you may also experience additional lag time when browsing the internet. This is because of the physical distance that the data packets need to travel.Most premium VPNs are aware of these issues and take measures to reduce them, like having plenty of servers available worldwide to prevent overcrowding.However, it is possible that using a fast VPN can actually speed up your connection, because of the practice of bandwidth throttling. Let us explain…What is bandwidth throttling? Bandwidth throttling is when your internet service provider (ISP) slows your internet connection as a response to certain online activities. Common activities that may lead to bandwidth throttling include streaming, torrenting, and gaming. ISPs engage in bandwidth throttling for many reasons, such as to prevent network congestion during peak usage hours.If you’ve been experiencing either a fluctuation in your internet connection speeds or significantly slower speeds than usual, you may be experiencing bandwidth throttling at the hands of your ISP.Fortunately, an easy way to get around bandwidth throttling is by using a VPN.What is a VPN? Here, we explain all(Image credit: Turtle Beach)How do VPNs solve bandwidth throttling?A VPN makes your internet activity completely anonymous from your ISP. If you connect through a VPN when gaming, your ISP won’t be able to see what you are doing and won’t be able to throttle your internet connection in response to your activity.There are other benefits to adding a VPN to your gaming setup. Protecting your privacy online is essential, especially if you ever game on a public Wi-Fi network. Such networks are commonly unencrypted, making you particularly vulnerable if you want to play at a hotel while traveling or on your phone at a coffee shop.You can also use VPNs to get around geo-blocks, accessing region-specific in-game perks or even trying out games that aren’t available in your country yet. You can use a VPN to get around geo-blocks on many streaming sites, unlocking content from around the world and ensuring that you’ll never run out of things to watch.The best providers offer mobile VPN apps for your tablet and smartphone, making it easy to connect on any device that you use to game.Having your ISP artificially slow your internet connection because of your online activity is a frustrating experience, not to mention a violation of your privacy.Fortunately, there’s a simple way to circumvent unfair bandwidth throttling. Using a VPN completely hides your online activity from your ISP and ensures that you’ll always have the speeds you need to finish that battle campaign with your friends.When selecting a VPN for gaming, look for one with a variety of servers to prevent overcrowding, as well as fast connection speeds. We like ExpressVPN for all these reasons, and it has a VPN app for routers, so you can beat back bandwidth throttling on any device that you use.What do we recommend?
